Constant-velocity joints allow a drive shaft to transmit power through a variable angle, at constant rotational speed, without an appreciable increase in friction or play. They are mainly used in front wheel drive vehicles. Modern rear wheel drive cars with independent rear suspension typically use CV joints at the ends of the rear axle halfshafts and increasingly use them on the drive shaft. Constant-velocity joints are protected by a rubber boot, a "CV gaiter", usually filled with molybdenum d

CV joints typically last about 100,000 miles. When they fail, they can't be repaired. They need to be replaced. The CV joint is sealed and protected by a rubber CV boot that keeps the grease in the joint and contaminants, such as dirt and water, out. When the boot fails because of a tear or hole, the constant velocity joint will fail eventually too.
