special type of second order linear ordinary differential equation. Their solutions are based on eigenvalues and corresponding eigenfunctions of linear operators defined via second-order homogeneous linear equations. The problems are identified as Sturm-Liouville Problems (SLP) and are named after J.C.F. Sturm and J. Liouville, who

An ordinary differential equation (ODE) is an equation containing an unknown function of one real or complex variable x , its derivatives, and some given functions of x . The unknown function is generally represented by a variable (often denoted y), which, therefore, depends on x . Thus x is often called the

After solving the characteristic equation the form of the complex roots of r_1 and r_2 should be: $\lambda \pm \mu i$. We refer back to the characteristic equation, we then assume that all the solution to the differential equation will be: $y(t) = e^{(rt)}$
By plugging in our two roots into the general formula of the solution, we get:
 $y_1(t) = e^{(\lambda + \mu i)t}$
