forms are part of the field of differential geometry, influenced by linear algebra.

Although the notion of a differential is quite old, the initial attempt at an algebraic organization of differential forms is usually credited to Élie Cartan with reference to his 1899 paper.

Some aspects of the exterior algebra of differential forms appears in Hermann

This text presents differential forms from a geometric perspective accessible at the advanced undergraduate level. The author approaches the subject with the idea that complex concepts can be built up by analogy from simpler cases, which,

A Geometric Approach to Differential Forms: Bachman, David ...

Differential forms are the dual spaces to the spaces of vector fields over Euclidean spaces. Vector fields over some space X are a bit more complex than vector spaces of n -tuples. At

The Nature of Differential Forms

In mathematics, the differential geometry of surfaces deals with the differential geometry of smooth surfaces with various additional structures, most often, a Riemannian metric.

A differential 1-form (or simply a differential or a 1-form) on an open subset of \mathbb{R}^2 is an expression $F(x;y)dx+G(x;y)dy$ where $F;G$ are \mathbb{R} -valued functions on the open set. A very important example of a differential is given as follows: If $f(x;y)$ is C^1 \mathbb{R} -valued function on an open set U , then its total differential (or exterior ...

Section 3.1 defines differential forms on Euclidean space, and section 3.2 introduces the exterior derivative. Section 3.3 discusses mappings and introduces what is usually called the "pullback" of a differential form.

In linear algebra, a one-form on a vector space is the same as a linear functional on the space. The usage of one-form in this context usually distinguishes the one-forms from higher-degree multilinear functionals on the space. For details, see linear functional. In

A differential form is a geometrical object on a manifold that can be integrated. A differential form ω is a section of the exterior algebra $\Lambda^* T^* X$ of a cotangent bundle, which makes sense in many contexts (e.g. manifolds, algebraic varieties, analytic space s , ...).

Among the high points on this route are the Gauss-Bonnet formula, the de Rham complex, and the Hodge theorem; these results show, in particular, that the central tool in reaching the main goal of global analysis is the theory of differential forms. This book is a comprehensive introduction to differential forms.
