Digital filters work by detecting cycles of various periods (lengths) in a signal, and then either attenuating (filtering) or passing those cycles, depending on their period. The cutoff period is the period at which the filter begins to attenuate the signal. Low-Pass filters attenuate periods below their cutoff period

Digital signal processing implements the use of computers to perform various digital processing operations. DSP (Digital Signal Processing) is not only limited to computer but can also be done using processors specifically made for them namely digital signal processors.

Best Digital signal processing projects using MATLAB

Functional processing blocks that are now being utilized in data conversion architectures to achieve faster data rates are digital IF processing, DDC (digital downconverter), and DUC (digital upconverter). These digital functions can be realized in DSPs and FPGAs and some big companies also build their own digital IF processing ASICs.

Digital Signal Processing in IF/RF Data Converters ...

It is the single most important technique in Digital Signal Processing. Using the strategy of impulse decomposition, systems are described by a signal called the impulse response. Convolution is important because it relates the three signals of interest: the input signal, the output signal, and the impulse response.
